SUMMARY

Full-stack developer. Rewrote the appraisal system 200+ employees use, from PHP to Laravel 12 on MySQL, and cut 8 to 12 working days of manual entry a year; built the Go service that bills seats through Midtrans and the Next.js screens HR runs records, leave, overtime and attendance on.

EXPERIENCE

PT. Multi Spunindo Jaya Sidoarjo, Indonesia
Management Information System Intern Jul 2025 – Dec 2025

- Replaced a manual 2 to 3 day quarterly entry step with an HRIS sync and bulk Excel import, saving 8 to 12 working days a year.
- Rewrote the Performance Appraisal system from native PHP to Laravel 12 on MySQL for 200+ employees.
- Built the appraisal period screens, dashboards and Excel/PDF export, then trained the admins who run the cycle.

80&Company Japan (Remote)
Full-stack Developer Feb 2025 – Jul 2025

- Built a video summarisation pipeline: it follows a YouTube channel by ID, reads each new video's auto-captions, and calls the OpenAI API for a summary and keywords.
- Shipped the interface for an AI video summarisation and content tool in Next.js and TypeScript.
- Put the shared Radix components under Storybook with Jest tests, so a change to a primitive was verified before it reached a page.

EDUCATION

Politeknik Negeri Malang Malang, Indonesia
Bachelor of Informatics Engineering · GPA 3.81 / 4.00 2022 – 2026

PROJECTS

muara, Job-Board Aggregator
Independent project Oct 2026 – Present

- Aggregates JobStreet, Greenhouse and Kalibrr into one database, logs how each run ended, and marks closed listings.

LMS Cache Strategy Benchmark
Bachelor thesis Feb 2026 – Jul 2026

- Built a Moodle-style LMS in Laravel 12 to test four cache strategies behind one interface, switched by one env value.
- Ran 336 k6 runs over 112 combinations of cache strategy, workload, Redis topology and concurrency up to 2,000 users, then tested the results with ANOVA and Tukey HSD.
- Measured 53 to 72 req/s across all four strategies at every level, with CPU at 86% or above from 100 users, so the cost sat in Eloquent hydration and repeated context resolution.

Pendekinlink, URL Shortener
Full-stack Developer Jan 2026

- Built a Hono shortener where Redis absorbs click counters, so a hot link does not serialise on a PostgreSQL row lock.
- Built the front end with HTMX and Alpine.js and no client-side router, so the page arrives rendered and the browser gets one small script.
- Put rate limiting in Redis-backed middleware, kept the schema in one Drizzle package, and shipped the monorepo to a VPS.

HRIS, Human Resource Information System
Full-stack Developer Apr 2025 – Jun 2025

- Built the seat-based subscription path on a Go (Gin, GORM) backend: the server holds the Midtrans charge and webhook, so a seat count moves only after the provider confirms payment.
- Prorated a mid-cycle upgrade by the daily price difference for the days left, and charged the full new price when a trial converted.
- Built attendance that refuses a clock-in outside the office radius, containerised the stack with Docker, and deployed to Azure.
- Built the record screens for employees, leave, overtime and documents in Next.js, with TanStack Table grids and react-hook-form against a Go and PostgreSQL API.

SKILLS

Languages: TypeScript, Go, PHP

Frontend: React, Next.js, Tailwind

Backend: Laravel, Gin, PostgreSQL, MySQL, Redis

Infrastructure: Docker, Azure

Testing: k6, Jest
